RE ENTERING THE EARLY LEARNING PHASE

Effort in. Evidence out.

The confidence you built inside the silo has become the barrier keeping you from leaving it.

We forget that there is enormous opportunity in the **early learning phase**. It is where momentum is born, where feedback becomes visible, and where new capabilities are assembled.

As adults become more capable, we tend to **silo** our expertise. When market conditions change or life conditions interrupt, the **confidence** built inside that **silo** does not automatically transfer. The other side of the coin is that the same repetition that made you effective can also build invisible barriers to leaving the **silo** with the same **confidence** that exists inside it.

This guide exists to correct that error. It restores the rules of early learning, resets standards, and rebuilds **self trust** so you can reenter the **early learning phase** and know exactly what to do when you get there.

Life Circuitry © Copyright 2024

PART 1:
THE EARLY LEARNING PHASE

Before the early learning phase can be used effectively, it must be correctly understood.

Most resistance to early learning does not come from incompetence, fear, or laziness. It comes from misclassification. Capable adults tend to label early learning as regression. This error inflates risk, distorts perception, and suppresses action.

In reality, the early learning phase is not a failure state. It is a structural phase of value creation that operates under a different set of rules. Until those rules are explicit, reentry will always feel unsafe.

Life Circuitry © Copyright 2024

1. WHAT THE EARLY LEARNING PHASE IS

The Core Question: What is early learning actually for?

The early learning phase is the stage where capability is being assembled, not displayed. Its function is not to perform at a high level, but to gather information, test assumptions, and establish new reference points.

It is characterised by:

- **High energy and engagement.** Attention is wide rather than narrow. Curiosity is active. Effort is present, but not yet refined.
- **Dedicated practice.** Repetition exists, but its purpose is discovery rather than optimisation. The goal is familiarity, not efficiency.
- **Usefulness before efficiency.** Actions are evaluated on whether they work at all, not on how well they work. Progress is measured by signal, not polish.
- **Low expectation of immediate results.** Outcomes are intentionally deprioritised. Feedback is the primary currency, not performance.
- **High opportunity for success.** Because standards are correctly repositioned, movement becomes possible. Small wins accumulate evidence. Momentum begins to form.

The early learning phase is information dense. It produces clarity faster than any other stage, provided it is entered with the correct expectations.

> **Think of it this way:**
>
> *Remember the first time you drove a car. You were checking mirrors constantly, gripping the wheel, overthinking every gear change. It was exhausting. But you were learning faster in that one afternoon than in any month of driving that followed. The early learning phase is that afternoon. It is uncomfortable precisely because it is doing so much work.*

Bonus Insight: Early learning is not inefficient... it is where efficiency is discovered.

Life Circuitry © Copyright 2024

2. WHAT THE EARLY LEARNING PHASE IS NOT

The Core Question: What are you assuming early learning says about you?

The early learning phase is commonly resisted because it is associated with loss of status, loss of competence, or loss of identity. These associations are false. Early learning is not:

- A signal of incompetence.
- A regression to a lower version of yourself.
- A negation of prior experience.
- A threat to identity or self worth.

Competence does not disappear when you enter early learning. It becomes latent. The problem is not ability. The problem is that the environment has changed, and existing capability no longer maps cleanly onto it.

Everything you know, everything you have built, every capability you have demonstrated in your life, you carried into this moment. None of it disappeared because the context changed. Your skills are not deleted. They are untethered. The job is to reanchor them, not to mourn them.

> **Think of it this way:**
>
> *A qualified chef who moves to a new country does not forget how to cook. But the ingredients are different, the kitchen is unfamiliar, and the customers expect different flavours. The skill is intact. The context has changed. The chef does not need to retrain. They need to recalibrate.*

Bonus Insight: If your standards are still set for mastery, you will misread learning as failure.

Life Circuitry © Copyright 2024

3. WHY EARLY LEARNING FEELS UNCOMFORTABLE FOR CAPABLE ADULTS

The Core Question: What changed: your ability, or the conditions?

As people become more capable, they naturally narrow their focus. Skills refine. Standards rise. Feedback becomes predictable. Confidence stabilises inside a known domain. This is not a flaw. It is how expertise is built.

However, this same process creates a hidden dependency: confidence becomes context bound. It is reinforced by familiarity, repetition, and known outcomes. Over time, safety is mistaken for permanence.

When conditions change, whether through market shifts, life disruption, or loss of relevance, the environment that once reinforced confidence no longer exists. You are not less capable, but the rules have changed.

Early learning feels threatening because it removes familiar reference points. Standards no longer apply. Performance drops by design. Feedback becomes noisy again. For someone accustomed to operating with precision, this feels like loss. It is not. It is recalibration.

> **Think of it this way:**
>
> *Imagine you have played guitar for twenty years. You can play complex songs without thinking. Then someone hands you a piano. You know music theory. You understand rhythm, melody, and structure. But your fingers do not know where to go. The discomfort you feel is not incompetence. It is the gap between what you know and what your hands can do in this new context. That gap is the early learning phase. And it closes faster than you think, because you are not starting from nothing. You are starting from everything you already know, applied to a new instrument.*

Bonus Insight: Confidence did not vanish. It became misaligned with the new environment.

Life Circuitry © Copyright 2024

4. THE CORE ERROR

The Core Question: Are you measuring learning, or performance?

The primary error is treating early learning as a performance phase. When high standards designed for mastery are applied to learning, the result is predictable: hesitation, avoidance, and paralysis.

Early learning requires a deliberate reset of expectations. Your job is not to prove you are already good at the thing. Your job is to enter the phase, collect feedback, and build evidence that you can operate under new conditions. This is how self trust is rebuilt.

If you insist on performing before you have reestablished reference points, you will treat every imperfect rep as proof that you are not ready. That is not an honest assessment. It is the wrong measurement tool applied to the wrong phase.

> **Think of it this way:**
>
> *If you weigh a six month old baby and compare it to the weight of a grown adult, the baby fails. That does not mean the baby is broken. It means you used the wrong scale. When you apply expert level metrics to a learning phase, you get the same result. The measurement is the problem, not the person.*

Bonus Insight: Standards do not disappear in early learning. They change. Expectations are repositioned so performance can climb again.

Life Circuitry © Copyright 2024

PART 2:
THE SILO EFFECT

Part 1 described what the early learning phase is and why it is resisted. Part 2 explains the structural mechanism that makes reentry so difficult.

The Silo Effect is not a personality trait. It is a predictable consequence of how the brain processes expertise. The more competent you become inside a domain, the more your identity fuses with that domain. When conditions change, the silo that once protected your confidence becomes the barrier that prevents you from adapting.

Understanding this mechanism is the difference between blaming yourself and diagnosing the actual problem.

Life Circuitry © Copyright 2024

HOW EXPERTISE NARROWS ATTENTION

The Core Question: Has your focus become a filter?

When you first learn something, your attention is wide. You are scanning for patterns, collecting information, and remaining open to unexpected connections. As you become more skilled, your attention narrows. This is efficient. It is also a trap.

The more you practise inside a silo, the more your brain optimises for that specific environment. Your confidence becomes conditional on the conditions remaining stable. Your identity fuses with your competence. You stop being a person who happens to be good at something and start being the thing you are good at.

This is why disruption hits so hard. When the conditions of your silo change, whether through market shifts, life events, health changes, relationship breakdowns, or any external force, you do not just lose your footing. You lose your frame of reference for who you are.

> **Think of it this way:**
>
> *A long distance truck driver who has driven the same route for fifteen years can do it almost on autopilot. But if that route is permanently closed and replaced with a completely new network of roads, the driver does not lose the ability to drive. They lose the map they built in their head. Everything feels harder because the automatic system that made it effortless was tuned to a landscape that no longer exists. The skill is still there. The map needs rebuilding.*

Bonus Insight: The more you practise your expertise inside the silo, the more invisible the barriers become. They only reveal themselves when you try to leave.

Life Circuitry © Copyright 2024

THE CONFIDENCE TRAP

The Core Question: Is your confidence portable, or conditional?

Confidence built inside a silo is conditional confidence. It only works within the boundaries of the environment that produced it. It is context dependent, and when the context disappears, the confidence collapses with it.

This is not a character flaw. It is a structural consequence of how the brain processes competence. The brain does not separate "I am confident because I have practised this specific thing in this specific context" from "I am a confident person." It blends them. So when the context is removed, the person does not think, "I have lost access to my specific competence." They think, "I have lost myself."

This is why capable people freeze when conditions change. It is not that they lack ability. It is that their ability was fused to a context that no longer exists, and the brain reads the absence of that context as the absence of capability.

> **Think of it this way:**
>
> *A project manager who has run a team of twenty for a decade feels completely in control. They know the politics, the processes, the personalities. Then the company restructures and they are moved to a new division with new people and new systems. Nothing about their actual skill has changed. But the feeling of confidence has vanished because it was anchored to the old team, not to the skill itself. That is conditional confidence. It works in one room and disappears in another.*

Bonus Insight: If your confidence only works inside the silo, it is not confidence. It is familiarity.

Life Circuitry © Copyright 2024

THE ERROR: GROWING FOCUS ON WHAT IS NOT GOING RIGHT

The Core Question: What is your attention selecting for: risk, or opportunity?

When siloed expertise meets disruption, the brain does something predictable and destructive. It shifts its entire focus onto what is not going right. This is not a conscious decision. It is an automatic response designed to protect you from risk.

The brain treats unfamiliarity as threat. So when you step outside your silo, voluntarily or not, your attention narrows further. But now it narrows onto risk, loss, and potential failure. Opportunities for growth, learning, and success become invisible. Not because they are absent. Because your threat detection system has overridden your opportunity detection system.

This creates a feedback loop. The more you focus on what is going wrong, the more evidence you collect that you are failing. The more evidence of failure you collect, the less willing you are to act. The less you act, the less evidence of capability you generate. And the cycle tightens.

> **Think of it this way:**
>
> *You start a new job. On your first day, you cannot find the bathroom, you do not know anyone's name, and you accidentally reply all to a company wide email. If you focus on those three things, you will conclude the day was a disaster. But you also showed up, introduced yourself to your team, completed your onboarding, and asked good questions in a meeting. The day contained both. Your brain just chose to spotlight the failures because the environment was unfamiliar. That spotlight is the error.*

Bonus Insight: Error is the growing focus on what is not going right, encouraging a fixed mindset. Correction is recalibrating what you are measuring.

Life Circuitry © Copyright 2024

PART 3:
THE DIAGNOSTIC CORRECTION

The errors described in Part 2 are not personality defects. They are diagnostic errors: predictable, structural, and correctable.

The correction does not require motivation. It does not require therapy. It requires accuracy. Each correction below identifies a specific misalignment and provides the recalibration needed to reenter the early learning phase without the identity crisis that typically accompanies it.

Life Circuitry © Copyright 2024

CORRECTION 1: EARLY LEARNING IS NOT INCOMPETENCE

The Core Question: Did your capability disappear, or did the context change?

Being in the early learning phase does not mean you are incompetent. It means you are in the early learning phase. These are two entirely different statements, but the brain under threat treats them as identical.

Everything you know, everything you have built, every capability you have demonstrated in your life, you carried into this moment. None of it disappeared because the context changed. Your skills are not deleted. They are untethered. The job is to reanchor them, not to mourn them.

> **Think of it this way:**
>
> *An electrician who moves from residential wiring to industrial automation does not forget Ohm's law. They do not forget how circuits work. But the systems are bigger, the standards are different, and the tools are unfamiliar. They are not incompetent. They are an electrician learning a new application of something they already understand deeply. The foundation is solid. The surface is new.*

Bonus Insight: You are not starting from scratch. You are starting from experience in a new direction.

Life Circuitry © Copyright 2024

CORRECTION 2: LOW EXPECTATIONS ARE REPOSITIONED STANDARDS

The Core Question: Are you measuring the right thing for this phase?

Low expectations are not low standards. This is the reframe that changes everything. When you enter the early learning phase, you are not abandoning your standards. You are repositioning them.

Your standard for effort remains high. Your standard for commitment remains high. Your standard for showing up remains high. What changes is your expectation of what those efforts will produce in the short term. This is not a compromise. This is accuracy. It is the honest acknowledgement that skill acquisition has a timeline, and you are at the beginning of it.

When expectations are calibrated correctly, low and matching the phase, every positive outcome registers as a success. The early learning phase becomes a place where success is easy to find because you have stopped demanding that it look like expert level output.

> **Think of it this way:**
>
> *When a professional athlete recovers from a major injury, their physio does not set the first goal as "run a marathon." The first goal might be "walk to the letterbox." That is not a low standard. That is an accurate target for the phase they are in. And when they reach the letterbox, it is a genuine win. Not because the letterbox is impressive, but because the standard for effort was maintained while the expectation for outcome was correctly repositioned.*

Bonus Insight: Repositioned expectations are not lowered ambitions. They are accurate targets for the current stage of the journey.

Life Circuitry © Copyright 2024

CORRECTION 3: PERFORMANCE DROPS BY DESIGN, NOT BY FAILURE

The Core Question: Is the drop a problem, or is it the entry fee?

When you move from an expert domain into a learning domain, your performance will drop. This is guaranteed. It is also irrelevant, because performance in the early learning phase is not the metric that matters.

What matters is engagement. Are you in the arena? Are you collecting feedback? Are you adjusting? If the answer is yes, the performance drop is not a failure. It is the entry fee for the next level of growth. Every expert you have ever admired paid this same fee. They simply paid it before you were watching.

> **Think of it this way:**
>
> *A senior accountant who decides to learn public speaking will give a terrible first presentation. Their voice will shake, their slides will be clunky, and they will probably talk too fast. None of that means they are bad at communicating. It means they are doing the thing for the first time in a new context. The performance drop is the price of showing up. And the second presentation will be better than the first, because the feedback loop has started.*

Bonus Insight: A performance drop in a new domain is not evidence of inability. It is evidence that you are actually doing the work.

Life Circuitry © Copyright 2024

CORRECTION 4: TRUST MUST BE REBUILT PROCEDURALLY, NOT EMOTIONALLY

The Core Question: Are you waiting to feel ready, or generating evidence?

Self trust does not return because you decide it should. It returns because you generate evidence that you can act, adapt, and produce results in a new context. The procedure is simple: act, observe the result, adjust, act again. Each cycle deposits a small unit of evidence into your self trust account.

Trying to feel your way back to trust is the wrong approach. Feelings follow evidence. If you wait until you feel ready, you will wait indefinitely because the feeling of readiness comes from having already done the thing you are waiting to feel ready for. The circuit only closes when you move.

> **Think of it this way:**
>
> *Think about the first time you cooked a meal for guests. You did not feel confident before you did it. You felt nervous. But you did it anyway. And when people ate the food and said it was good, something shifted. Not because someone told you to feel confident. Because the evidence arrived. Self trust works the same way. You do not wait for the feeling. You do the thing, and the feeling follows.*

Bonus Insight: You cannot think your way back to self trust. You can only act your way back.

Life Circuitry © Copyright 2024

PART 4:
THE PRACTICE FRAMEWORK

Understanding the corrections is necessary but insufficient. The early learning phase requires action, and action requires a framework.

This section provides the operational sequence: what to actually do differently when reentering the early learning phase. Each step is designed to close the gap between knowing what is wrong and doing what works.

Life Circuitry © Copyright 2024

STEP 1: IDENTIFY THE CHALLENGE FIRST, THEN SELECT THE ACTIVITY

The Core Question: Are you solving a real gap, or filling time with familiar activity?

Most people, when they decide to learn something new, start with the activity. They pick a course, a book, a project, or a programme, and then try to fit themselves into it. This is backwards.

The correct sequence is to identify the specific challenge you are facing, the gap between where you are and where you need to be, and then select the activity that directly addresses that gap. This is the difference between busy work and targeted practice. Busy work fills time. Targeted practice closes gaps.

If you default to familiar activities, you will stay inside your silo even while believing you have left it. The challenge must come first. The activity follows.

> **Think of it this way:**
>
> *If your car will not start, you do not randomly start replacing parts. You diagnose the problem first. Is it the battery? The starter motor? The fuel pump? The diagnosis determines the action. Learning works the same way. Identify what is actually missing before you choose what to do about it. Otherwise you will spend six months on a course that teaches you something you did not need.*

Bonus Insight: Do not find an activity and then look for a challenge. Find the challenge and then build the activity around it.

Life Circuitry © Copyright 2024

STEP 2: RECALIBRATE YOUR MEASUREMENT

The Core Question: Are you measuring effort, or demanding output?

In the early learning phase, your measurement system must change. You are no longer measuring output quality. You are measuring input consistency. Did you show up? Did you practise? Did you engage with the discomfort? These are the metrics that matter in this phase.

Measuring output quality in the early learning phase is like weighing a seed and being disappointed it is not a tree. The seed is doing exactly what it is supposed to do. You are simply measuring the wrong thing.

> **Think of it this way:**
>
> *When you start going to the gym after years away, the correct measurement is not how much you can lift. It is whether you went. Three sessions in the first week is a win, regardless of whether you lifted five kilos or fifty. The weight will increase naturally as the habit takes hold. Measuring the wrong thing in the first week will convince you that you are failing, when in reality you are doing exactly what the phase requires.*

Bonus Insight: When you change what you measure, you change what you see. When you change what you see, you change what is possible.

Life Circuitry © Copyright 2024

STEP 3: MAINTAIN HIGH STANDARDS FOR PERFORMANCE

The Core Question: Is your standard about how you show up, or what you produce?

This may seem contradictory after a section about repositioning expectations, but it is not. Standards and expectations are different instruments measuring different things.

Your standard is how you show up. Full effort. Full attention. Full commitment to the process. Your expectation is what you predict the outcome will be. In the early learning phase, your standard stays high and your expectation drops. This combination is what produces rapid learning. High effort plus realistic expectations equals a feedback loop that generates evidence of progress rather than evidence of failure.

> **Think of it this way:**
>
> *A trainee surgeon does not lower their standard of care just because they are learning. They still wash their hands, follow the protocol, and give their full attention. But they do not expect to perform at the level of someone who has done the procedure a thousand times. The standard for conduct is absolute. The expectation for outcome is calibrated to the phase. Both exist at the same time.*

Bonus Insight: Maintain high standards for performance. Recalibrate expectations for outcomes. When expectations are low, outcomes are loud.

Life Circuitry © Copyright 2024

STEP 4: LET THE FEEDBACK LOOP CLOSE

The Core Question: Is your circuit open or closed?

The circuit only works when it closes. That means you must complete the loop: act, observe, adjust, act again. Every time you interrupt this loop, whether by overthinking before acting, ignoring feedback after acting, or refusing to adjust, you break the circuit and stall your momentum.

The early learning phase is the fastest environment for closing feedback loops because every action produces noticeable feedback. In an expert domain, the feedback is subtle and incremental. In the early learning phase, the signal is strong and clear. Use it.

> **Think of it this way:**
>
> *When a child learns to ride a bike, they do not sit in the house reading about balance and wheel physics. They get on the bike, fall off, adjust, and get back on. Every fall is feedback. Every wobble is data. The circuit closes every time they try again. Adults tend to do the opposite. They read, plan, analyse, and prepare until the preparation itself becomes the activity. The bike never moves.*

Bonus Insight: Stop rehearsing in your head. The marketplace does not trade in rehearsals. Close the circuit.

Life Circuitry © Copyright 2024

PART 5:
THE SYNERGY

The Early Learning Phase and the Value Hierarchy are not separate systems. Reentering the early learning phase is not stepping outside the Hierarchy. It is restarting the climb, deliberately, from Stage 1.

This section maps the five characteristics of early learning directly against the five stages of the Value Hierarchy. Understanding how they connect turns disruption from a collapse into a recalibration.

Life Circuitry © Copyright 2024

1. ENERGY AND EFFORT RESTARTS RECOGNITION

When you reenter the early learning phase with high energy and effort, you are restarting Stage 1 of the Value Hierarchy: Being Recognised. The marketplace needs to see that you are present, that you are willing, and that you are solving a problem. In this context, the problem you are solving may be your own reentry into relevance.

Recognition does not require mastery. It requires visibility. And visibility in the early learning phase comes from the willingness to show up and invest energy before the returns are clear.

In practice:

The person who turns up to a networking event knowing nobody and starts conversations anyway is not confident. They are visible. And visibility is the first requirement for the marketplace to acknowledge you exist.

Life Circuitry © Copyright 2024

2. DEDICATED PRACTICE EARNS FACILITATION

When you commit to dedicated practice, you make yourself easy to help. This corresponds to Stage 2: Being Facilitated. People invest in people who are clearly investing in themselves. When the marketplace sees someone practising with discipline, it responds by removing barriers and opening doors.

In practice:

When someone new to a team consistently shows up prepared, asks specific questions, and follows through on what they said they would do, others naturally start helping them. They share shortcuts, make introductions, and offer guidance. Not because they were asked, but because disciplined practice is visible and it invites support.

Life Circuitry © Copyright 2024

3. USEFULNESS CREATES REQUEST

When your early learning begins producing useful outcomes, even small ones, you move towards Stage 3: Being Requested. You do not need to be the best. You need to be useful. In a dynamic marketplace, someone who is useful right now is more valuable than someone who was excellent in a context that no longer exists.

In practice:

The colleague who can solve a small but annoying problem that nobody else has bothered with becomes the person people ask for. They are not the most experienced person in the room. But they are useful. And usefulness creates demand faster than expertise ever does.

Life Circuitry © Copyright 2024

4. CALIBRATED EXPECTATIONS BUILD RECOMMENDATION

When you maintain high standards while holding realistic expectations, you build the kind of consistent, reliable presence that earns Stage 4: Being Recommended. People recommend those they trust to deliver consistently, not those who occasionally perform brilliantly but unpredictably.

In practice:

A tradesperson who shows up on time, communicates clearly, and does solid work will get recommended over a more talented tradesperson who is unreliable. Consistency earns trust. Trust earns recommendations. It is not about being the best. It is about being dependable.

Life Circuitry © Copyright 2024

5. MASTERING REENTRY BECOMES THE REFERENCE

And here is the ultimate advantage. If you can master the process of reentering the early learning phase, of moving from expert to beginner to competent to expert again, you become Stage 5: The Reference. Not because you are the best at any single thing, but because you have demonstrated the ability to rebuild. In a marketplace that rewards adaptability, the person who can restart is the person who cannot be made obsolete.

> **In practice:**
>
> *The person who has successfully changed careers, learned new industries, and rebuilt from disruption more than once becomes the person others look to for guidance. Not because they know everything, but because they know how to start again. That is the reference. That is the standard.*

Bonus Insight: The early learning phase is not a step backward on the Value Hierarchy. It is the only way to restart the climb when the ladder has been moved.

Life Circuitry © Copyright 2024

THE HUMAN SUMMARY: FROM SILO TO CIRCUIT

If you are feeling stuck, it is likely because you built your confidence inside a silo, and the conditions that maintained that silo have changed.

You are not broken. Your context is broken. And the fix is not to wait until conditions return to normal, because they may not. The fix is to reenter the early learning phase deliberately, with your eyes open and your identity intact.

Life Circuitry © Copyright 2024

MOVING FROM FRICTION TO FLOW

If you cannot see the opportunity, you are measuring with expert level expectations in a beginner level context. Recalibrate.

If you feel like you are failing, you are applying the wrong standard to the wrong phase. Reposition.

If you cannot start, you are waiting for self trust to arrive before you act. It will not. Self trust is generated by action, not by readiness.

If you are stuck in your head, the circuit is open. You are rehearsing instead of trading. Close the loop.

If you are avoiding the early learning phase entirely, you are protecting a version of yourself that only exists inside conditions that have already changed. Let it go. The version of you that can adapt is more valuable than the version that was excellent in a world that no longer exists.

The goal is not to grieve the silo. The goal is to restart the circuit. Think small. Start horribly. And trust the process to do what it has always done: turn effort into evidence, evidence into competence, and competence into momentum.

That is the power of Life Circuitry. That is how you move again.

Life Circuitry © Copyright 2024

THE CIRCUIT CHECK

Where is your reentry stalling? Use this audit to identify your friction point.

Each check maps to a specific phase of reentry. If you answer NO, you have found your friction point. The correction tells you exactly what to do next.

Life Circuitry © Copyright 2024

REENTRY AUDIT

1. ENERGY CHECK

Are you investing real energy, or are you thinking about investing energy?

If NO: You are still in the conceptual landscape. Leave the rehearsal. Enter the arena.

2. PRACTICE CHECK

Are you practising deliberately, or defaulting to familiar activities?

If NO: You are still inside the silo. Find the challenge first, then build the activity.

3. MEASUREMENT CHECK

Are you measuring input consistency, or demanding expert level output?

If NO: You are using the wrong metric. Recalibrate what you are measuring.

4. EXPECTATION CHECK

Are your expectations matched to the learning phase, or to the expertise phase?

If NO: You are manufacturing failure. Reposition your expectations to match your stage.

5. TRUST CHECK

Are you generating evidence of capability through action, or waiting to feel ready?

If NO: You are waiting for a feeling that only comes from doing. Act first. Trust follows.

Life Circuitry © Copyright 2024

THINK SMALL

RE ENTER THE PHASE.

"The early learning phase is not where you lose yourself.
It is where you find what survives."

Life Circuitry © Copyright 2024
